Not illustrated. 1902 Excerpt: . the indicial function of N is the product of the indicial functions of T and 8 ; so that the indicial function of S , which gives all the regular integrals of N , is a factor of the indicial function of the original equation. The degree of the indicial function of S is equal to s , because $S = 0$ is an equation of order s of Fuchsian type; the degree of the indicial function of iv is $m-n$, where n is the characteristic index of $N = 0$. Hence $s + k = m-n$, that is, $8=m-n-k.m-n$; so that (assuming for the moment that k may be either zero or greater than zero) an upper limit for the number of regular integrals which an equation can possess is given by $m-n$, where m is the order of the equation, and n is its characteristic index (supposed to be greater than zero). It is known that, when $n = 0$, the number of regular integrals is equal to m . Corollary I. An equation, whose indicial function is a constant, so that its indicial equation has no roots, has no regular integrals; for its characteristic index is equal to its order. But such equations are not the only equations devoid of regular integrals. Corollary II. When k is equal to zero, then s is equal to $To-n$, so that the number of regular integrals of the equation is actually equal to the degree of the indicial function. The...
